Virtualization of Services in Cloud Networks

Customer A

Customer B

But: We need to be sure about its performance before deployment!

Agenda

- ▶ Introduction to OpenFlow
- ▶ Modeling OpenFlow
- ▶ Performance Measurements
- ▶ Results
- ▶ Outlook

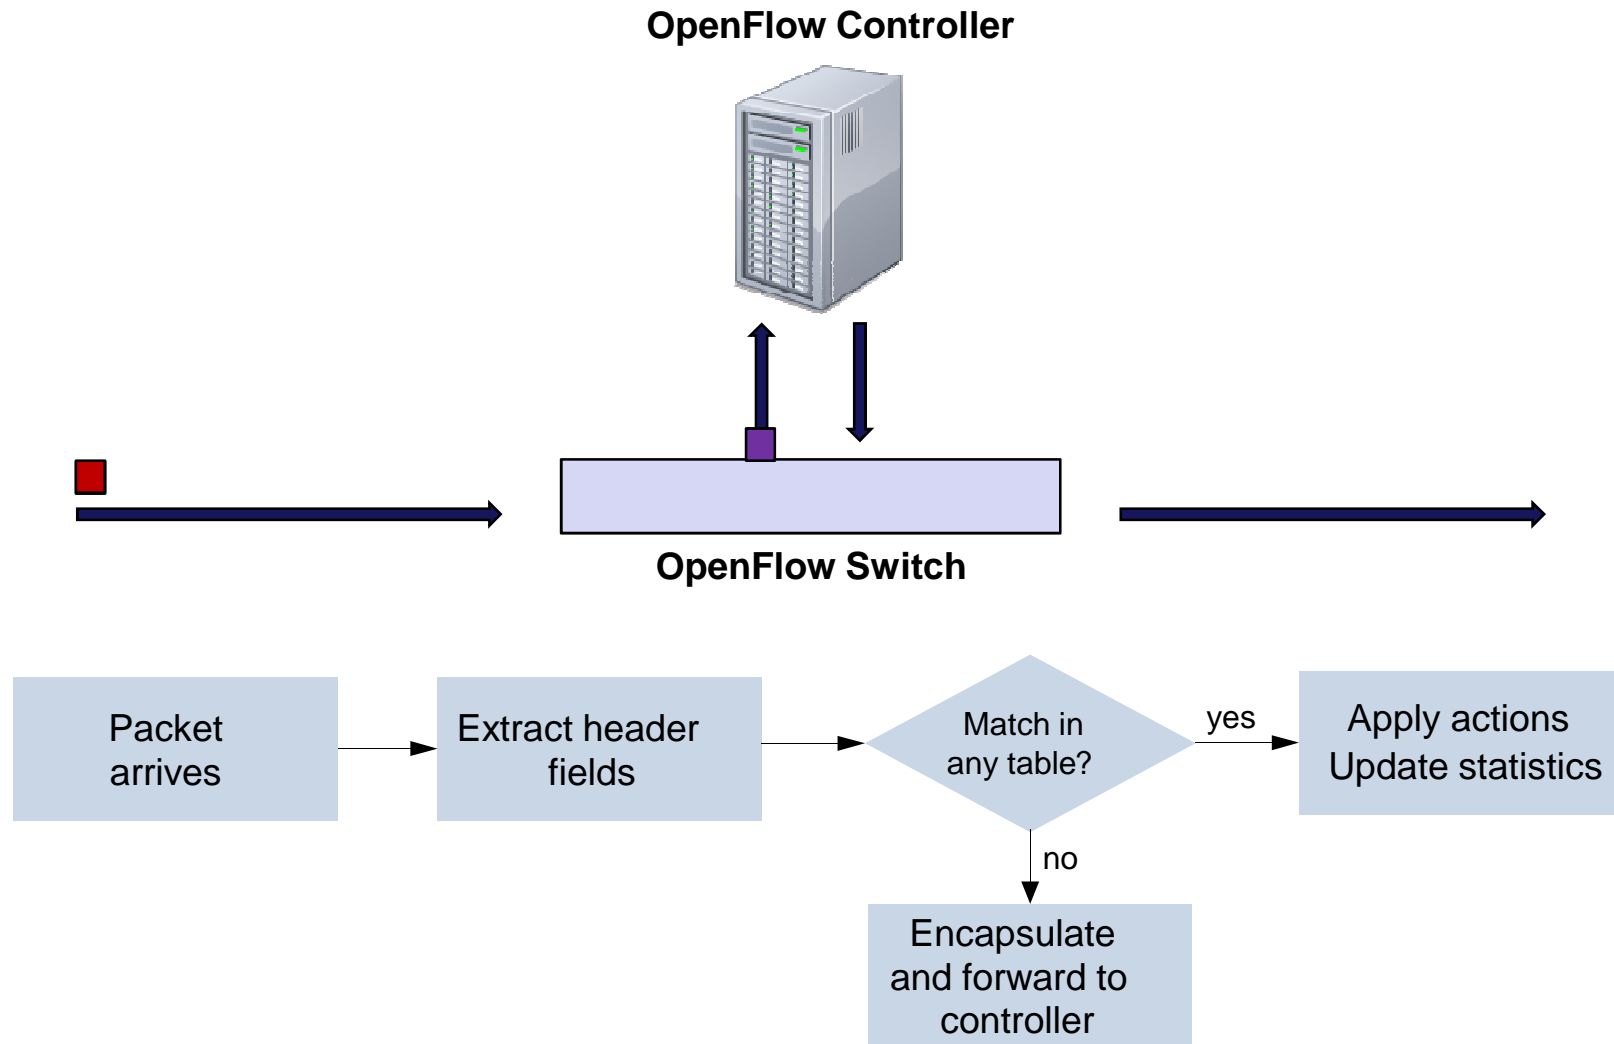

Introduction to OpenFlow

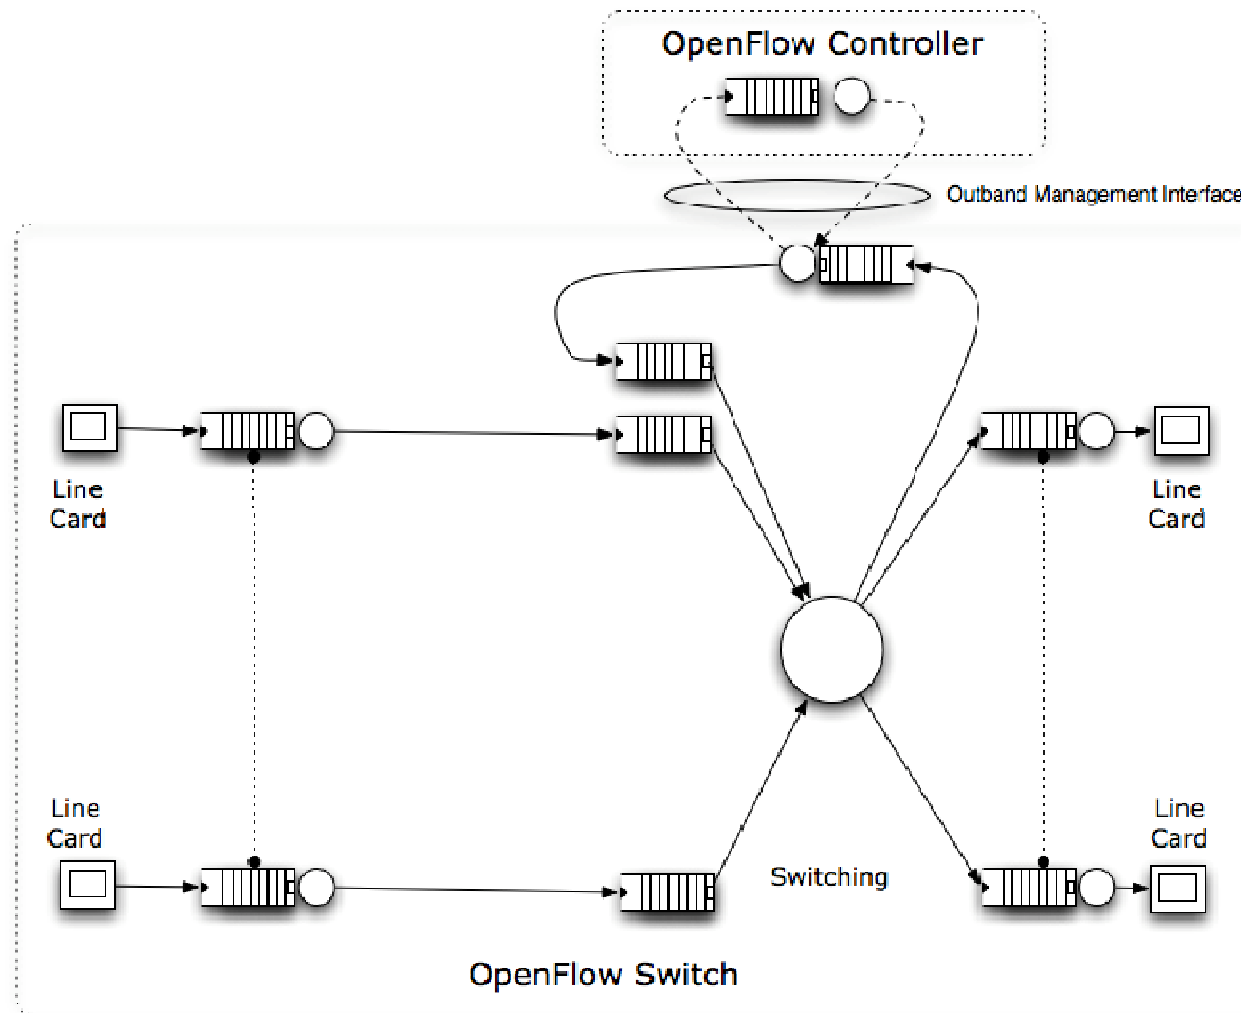

- ▶ OpenFlow is a specification/open standard
- ▶ Test of new ideas in real networks
- ▶ Version 1.1 released in March 2011
- ▶ Integration available in commercial switches, wireless access points and routers  **NEC** ...
- ▶ Opens access to the control plane of switching components
→ separation of hardware and control plane
- ▶ Supported by the  **OpenNetworkingFoundation**

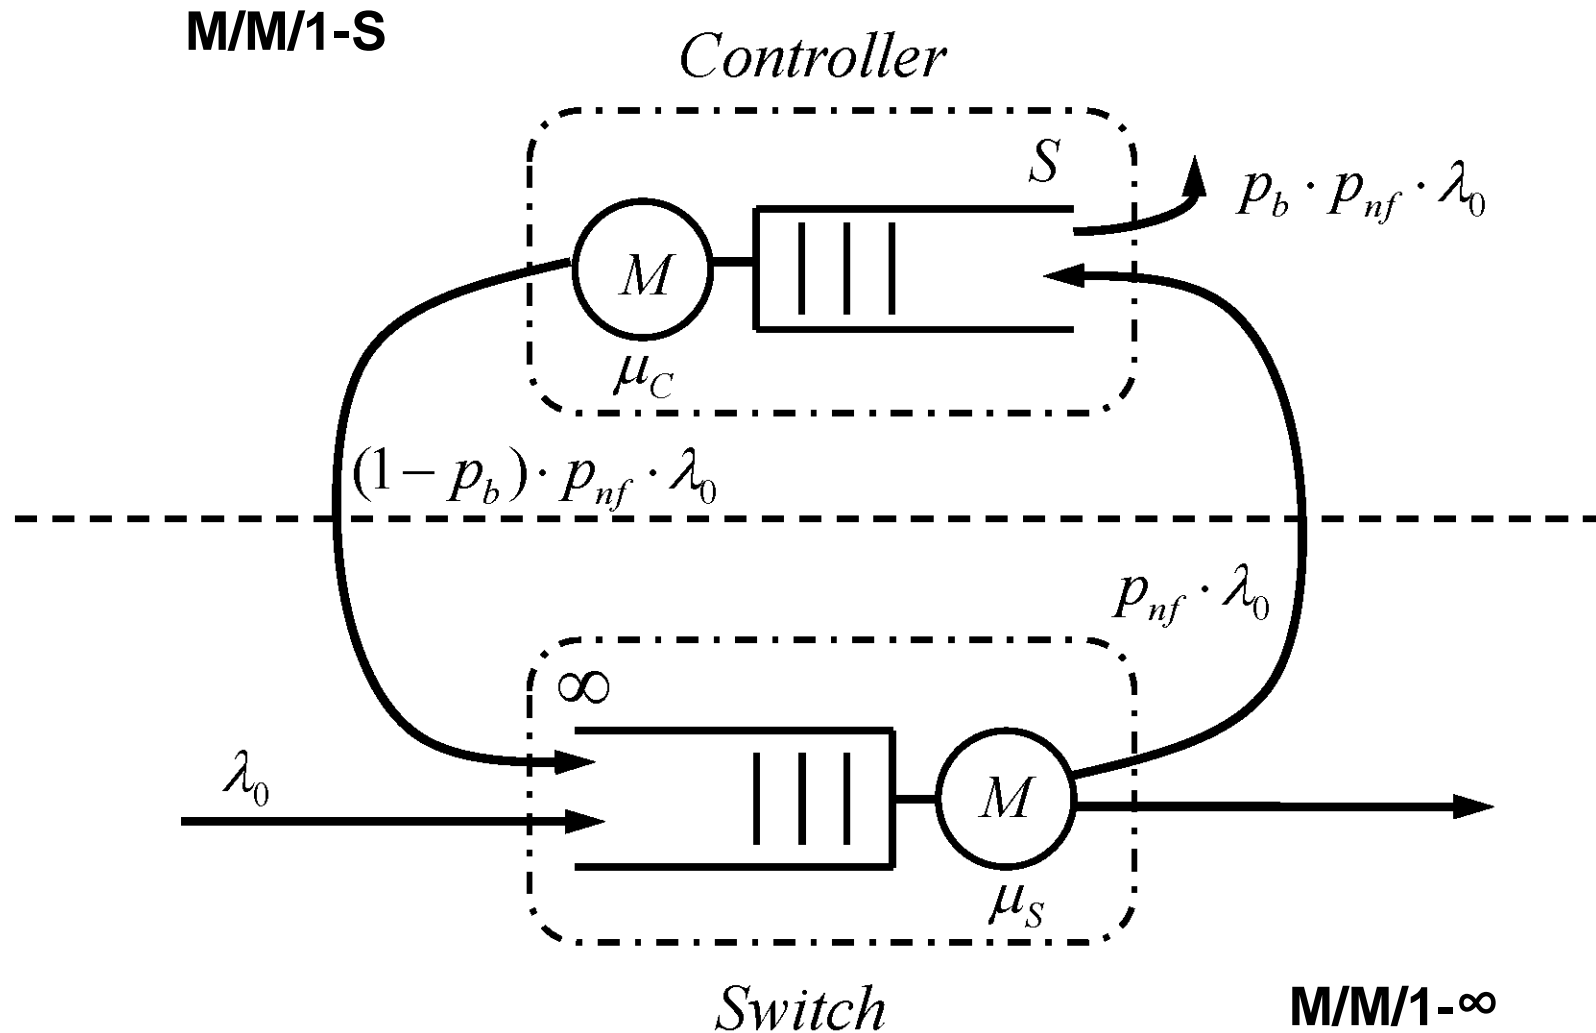

Reactive OpenFlow Switch-Controller System

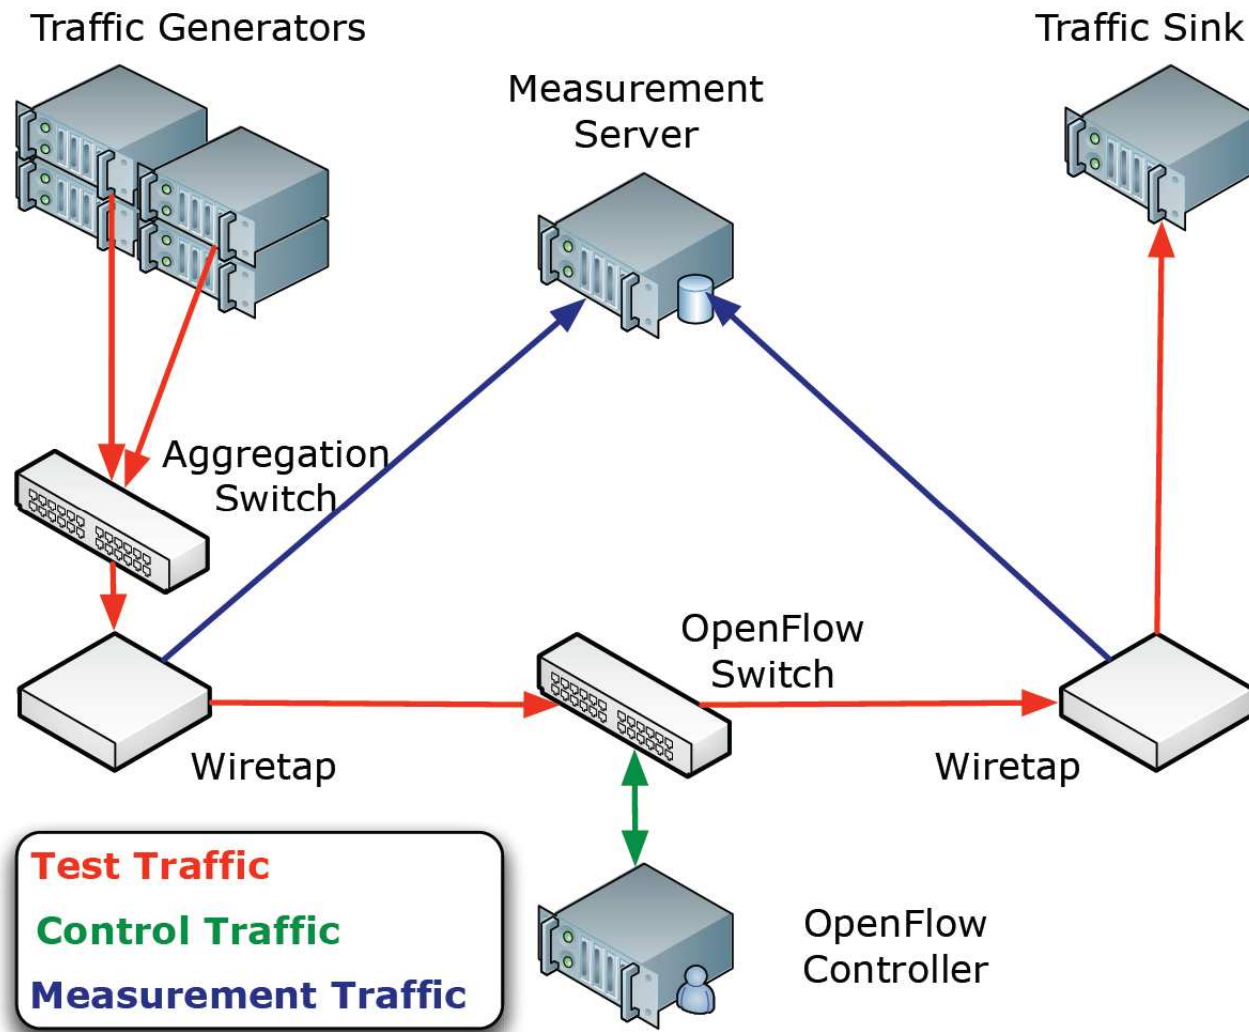

OpenFlow Node Model

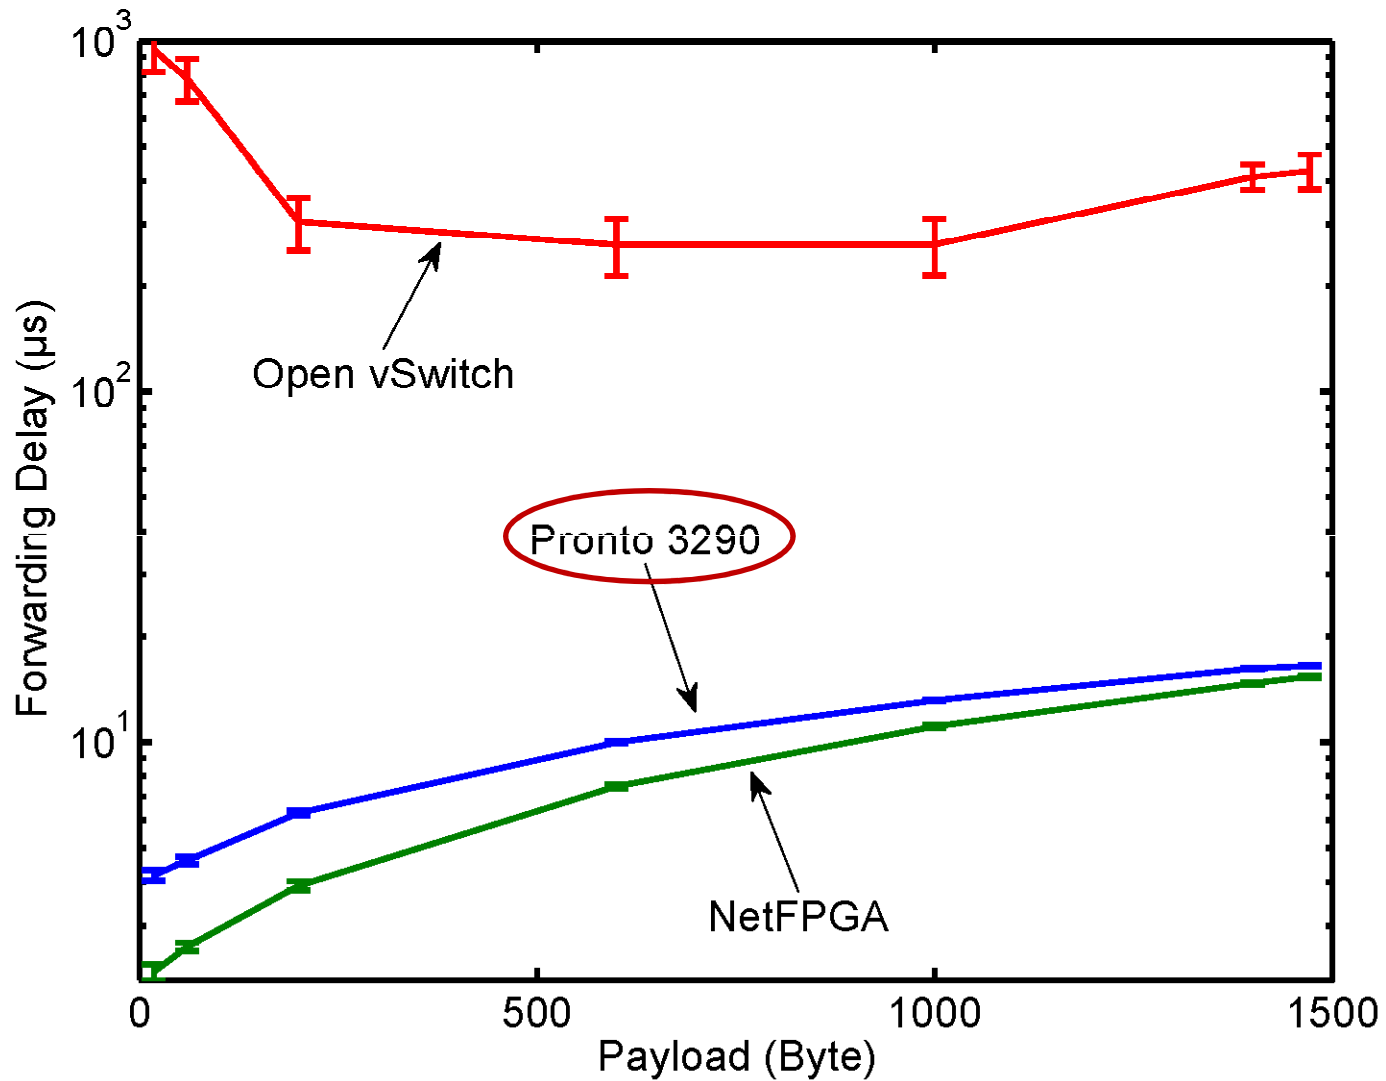

Simplified OpenFlow Switch-Controller Model

Measurements – Testbed Setup

Measurements – Switch Delay

Mean Sojourn Time for $E[B_C]=240 \mu\text{s}$

Mean Sojourn Time for $E[B_C]=240 \mu\text{s}$

Mean Sojourn Time for $E[B_C]=240 \mu\text{s}$

Mean Sojourn Time for $E[B_C]=240 \mu s$

Coefficient of Variation (Sojourn Time)

Coefficient of Variation (Sojourn Time)

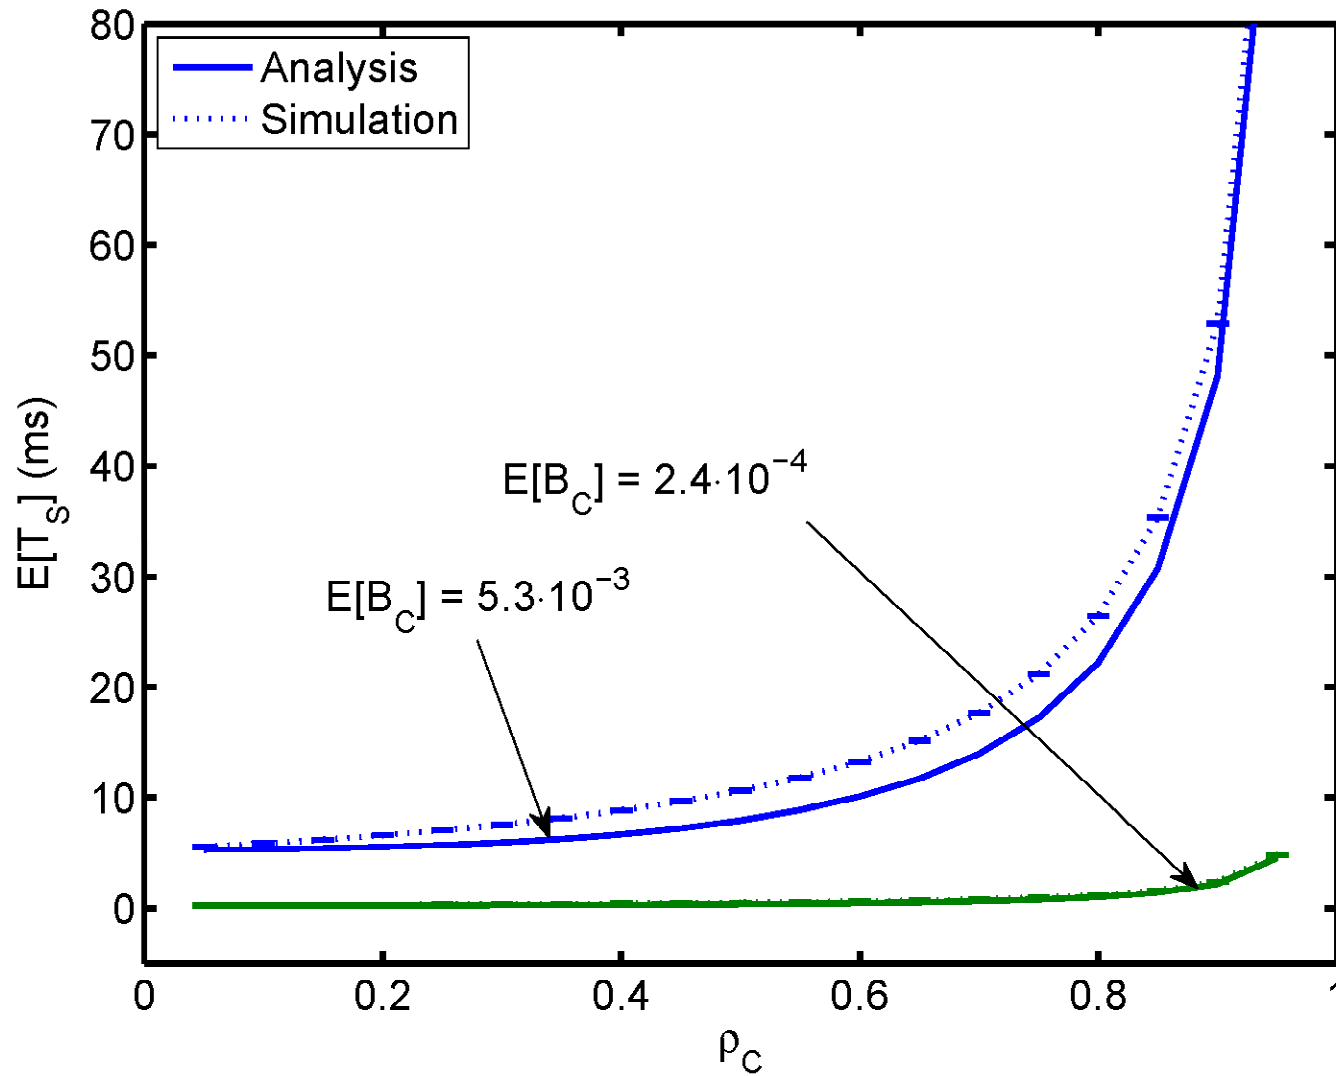

Coefficient of Variation (Sojourn Time)

Coefficient of Variation (Sojourn Time)

Influence of Controller Service Time for Pnf=0.04

Conclusion

- ▶ The complex OpenFlow system can be adequately modeled using our simple approach
- ▶ Results indicate that the OpenFlow approach is sound
- ▶ However: Negative performance impact is notable in conjunction with low-end hardware and/or high loads
- ▶ Current Work
 - Investigation of different controller behaviours
 - Introduction of a more detailed analytical model
 - Analysis of several systems interacting with each other
